Occurrence of coppice dunes is as shown on 1935 aerial photographs; many of these areas are now occupied by buildings and roads. These dunes tend to occur primarily in areas where textures of upper horizons are sand or loamy sand, and where there is little or no gravel. The dunes are most extensive in level to gently sloping areas but are less common in dissected terrain.

Bedrock Areas

- **L**: Sedimentary includes areas of soils classified at the great group level and above.
- **R**: Rhyolite Small bedrock areas not designated (see detailed map in Volume III).
- **V**: Volcanic (undiff.)
